QUALIFICATION FOR HYPERBARIC OXYGEN TREATMENT

In order to eliminate the possible adverse effects, the qualification for hyperbaric oxygen treatment is necessary.

Conversation and qualification tests conducted by the hyperbaric physician should also determine the benefits that HBOT therapy can bring for the patient in the case of diseases which are not included in the reimbursement list of National Health Service.

In order to qualify a patient for hyperbaric oxygen therapy, apart from the existing medical records the following tests have to be provided:

chest X-ray from the last year,

electrocardiography test from last year,

in the case of sudden deafness, tinnitus, dizziness, hearing disorders - audiogram,

in the case of inflammatory changes - the result of a wound inoculation,

in the case of osteomyelitis - scintigraphy results or tests confirming inflammation.

In the case of other diseases doctor during the qualifying visit can recommend conducting some additional tests which allow the safe treatment of the patient in a hyperbaric chamber for the time of treatment.
